Altera MAX 10 FPGAs feature a user flash memory (UFM) block that stores non-volatile information.

The UFM provides an ideal storage solution that you can access using Avalon Memory Mapped (Avalon-MM) slave interface to UFM.

The UFM block also offers the following features.

Features	Capacity
Endurance	Read and write counts up to 10,000 cycles
Data retention	<ul style="list-style-type: none"><li>• 20 years at 85 °C</li><li>• 10 years at 100 °C</li></ul>
Maximum operating frequency	<ul style="list-style-type: none"><li>• Serial interface: 7.25 MHz</li><li>• Parallel interface: 116 MHz</li></ul>
Data length	Stores data of up to 32-bit length

The UFM architecture of MAX 10 devices is a combination of soft and hard IPs. You can only access the UFM using the Altera On-Chip Flash IP core in the Quartus II software.

## UFM and CFM Array Size

Each array is organized as various sectors. You can erase each page or sector independently. The Altera On-Chip Flash IP core also gives you access to configuration flash memory (CFM) based on your specification in the parameter editor.

**Table 2-1: UFM and CFM Array Size**

This table lists the dimensions of the UFM and CFM arrays.

Device	Pages per Sector					Page Size (Kb)	Total User Flash Memory Size (Kb)	Total Configuration Memory Size (Kb)
	UFM1	UFM0	CFM2	CFM1	CFM0			
10M02	3	3	0	0	34	16	96	544
10M04	0	8	41	29	70	16	1248	2240
10M08	8	8	41	29	70	16	1376	2240
10M16	4	4	38	28	66	32	2368	4224
10M25	4	4	52	40	92	32	3200	5888
10M40	4	4	48	36	84	64	5888	10752
10M50	4	4	48	36	84	64	5888	10752

## UFM Memory Organization Map

The table below lists the memory organization map.

The address scheme changes based on the configuration mode you specify in the Altera On-Chip Flash parameter editor.

The following tables shows the dynamic UFM and CFM support based on different configuration mode and MAX10 FPGA variant.

## UFM Block Diagram

This figure shows the top level view of the Altera On-Chip Flash IP core block diagram. The Altera On-Chip Flash IP core supports both parallel and serial interfacing for all MAX 10 FPGAs, except for 10M02 devices. 10M02 devices only allow serial interface.

**Figure 2-1: Altera On-Chip Flash IP Core Block Diagram**

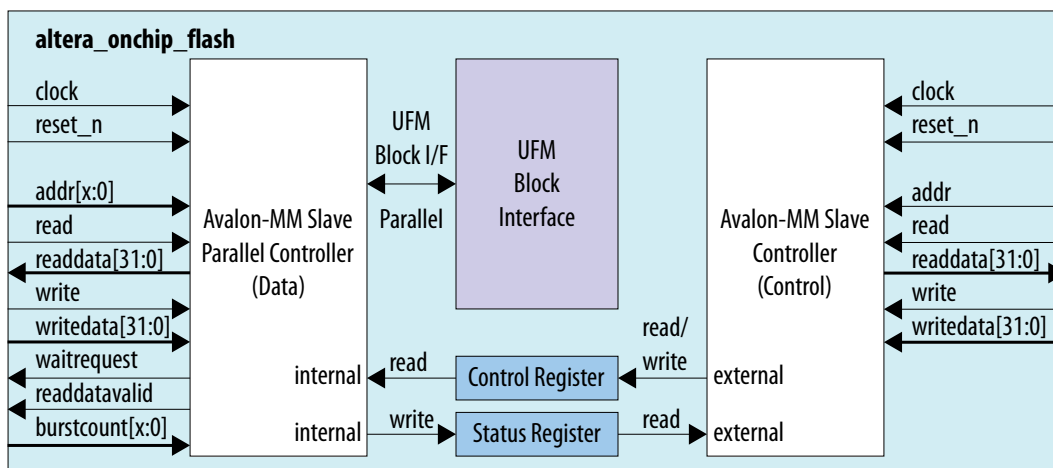

This IP block has two Avalon-MM slave controllers:

- Data—a wrapper of the UFM block that provides read and write accesses to the flash.
- Control—the CSR and status register for the flash, that is required only for write and erase operations.

These figures show the detailed overview of the Avalon-MM interface during read and write operation.

**Figure 2-2: Altera On-Chip Flash IP Core Avalon-MM Slave Read and Write Operation in Parallel Mode**

This diagram shows the standard interface for all 10M04, 10M08, 10M16, 10M25, 10M40, and 10M50 devices in parallel mode.

**Figure 2-3: Altera On-Chip Flash IP Core Avalon-MM Slave Read and Write Operation in Serial Mode**

This diagram shows the standard interface for all MAX 10 devices in serial mode.

These figures show the detailed overview of the Avalon-MM interface during read only operation.

Figure 2-4: Altera On-Chip Flash IP Core Avalon-MM Slave Read Only Operation in Parallel Mode

Figure 2-5: Altera On-Chip Flash IP Core Avalon-MM Slave Read Only Operation in Serial Mode

## UFM Operating Modes

The UFM block offers the following operating modes:

- Read
- Burst read
- Write
- Sector erase
- Page erase
- Sector write protection

You can choose one of the following access mode in the Altera On-Chip Flash parameter editor to read and control the operations.

- Read and write mode—this mode allows both data and control slave interface. This mode is applicable for both UFM and CFM sectors.
- Read only mode—this mode allows only data slave interface, and restricted to only read operations. This mode is applicable for both UFM and CFM sectors.
- Hidden—this mode does not allow any read or write operations. This mode is applicable only for CFM sectors.

The following table shows the comparison between parallel and serial modes.

**Table 2-4: Comparison between Parallel Mode and Serial Mode**

Feature	Parallel Mode	Serial Mode
Avalon-MM Data Interface	Parallel mode with 32-bit data bus	Serial mode with 32 bits based burst count
Access Mode	<ul style="list-style-type: none"><li>• Read and write</li><li>• Read only</li><li>• Hidden</li></ul>	<ul style="list-style-type: none"><li>• Read and write</li><li>• Read only</li><li>• Hidden</li></ul>
Read Mode	<ul style="list-style-type: none"><li>• Incrementing burst read</li><li>• Wrapping burst read</li></ul>	Incrementing burst read only
Write Operation	Single 32-bit parallel write operation	Single 32-bit serial write operation

There are several considerations that require your attention to ensure the success of your designs. Unless noted otherwise, these design guidelines apply to all variants of this device family.

## Guideline: UFM Power Supply Requirement

**Caution:** When performing any UFM write or erase operations, make sure you provide stable power connection. Loss of power supply during a write or erase operation can cause damage to the device.

## Guideline: Program and Read UFM with JTAG

You can program UFM using JTAG interface version IEEE Standard 1149.1.

The JTAG interface supports Jam™ Standard Test and Programming Language (STAPL) Format File (**.jam**), Programmer Object File (**.pof**), and JAM Byte Code File (**.jbc**).

## Guideline: UFM Content Initialization

You can initialize the UFM content using Altera software.

The initial memory content supports Memory Initialization File (**.mif**), and Hexadecimal (Intel-Format) File (**.hex**).

You can initialize the UFM content using either one of the following ways:

- Set the initial memory content through the Altera On-Chip Flash IP core.
- Set the initial memory content through the **Convert Programming File** tool in the Quartus II software when you convert **.sof** to **.pof**.

## Altera On-Chip Flash IP Core

The Altera IP core design flow helps you get started with any Altera IP core.

### Introduction to Altera IP Cores

Altera® and strategic IP partners offer a broad portfolio of off-the-shelf, configurable IP cores optimized for Altera devices. The Altera Complete Design Suite (ACDS) installation includes the Altera IP library. The OpenCore and OpenCore Plus IP evaluation features enable fast acquisition, evaluation, and hardware testing of Altera IP cores.

You can integrate optimized and verified IP cores into your design to shorten design cycles and maximize performance. The Quartus II® software also supports IP cores from other sources. Use the IP Catalog to efficiently parameterize and generate a custom IP variation for instantiation in your design.

The Altera IP library includes the following IP core types:

- Basic functions
- DSP functions
- Interface protocols
- Memory interfaces and controllers
- Processors and peripherals

**Note:** The IP Catalog (**Tools > IP Catalog**) and parameter editor replace the MegaWizard™ Plug-In Manager for IP selection and parameterization, beginning in Quartus II software version 14.0. Use the IP Catalog and parameter editor to locate and parameterize Altera and other supported IP cores.

### Specifying IP Core Parameters and Options

The parameter editor GUI allows you to quickly configure your custom IP variation. Use the following steps to specify IP core options and parameters in the Quartus II software. Refer to *Specifying IP Core Parameters and Options (Legacy Parameter Editors)* for configuration of IP cores using the legacy parameter editor.

© 2014 Altera Corporation. All rights reserved. ALTERA, ARRIA, CYCLONE, ENPIRION, MAX, MEGACORE, NIOS, QUARTUS and STRATIX words and logos are trademarks of Altera Corporation and registered in the U.S. Patent and Trademark Office and in other countries. Altera warrants performance of its semiconductor products to current specifications in accordance with Altera's standard warranty, but reserves the right to make changes to any products and services at any time without notice. Altera assumes no responsibility or liability arising out of the application or use of any information, product, or service described herein except as expressly agreed to in writing by Altera. Altera customers are advised to obtain the latest version of device specifications before relying on any published information and before placing orders for products or services.

ISO  
9001:2008  
Registered

1. In the IP Catalog (**Tools > IP Catalog**), locate and double-click the name of the IP core to customize. The parameter editor appears.
2. Specify a top-level name for your custom IP variation. The parameter editor saves the IP variation settings in a file named *<your\_ip>.qsys*. Click **OK**.
3. Specify the parameters and options for your IP variation in the parameter editor, including one or more of the following. Refer to your IP core user guide for information about specific IP core parameters.
  - Optionally select preset parameter values if provided for your IP core. Presets specify initial parameter values for specific applications.
  - Specify parameters defining the IP core functionality, port configurations, and device-specific features.
  - Specify options for processing the IP core files in other EDA tools.
4. Click **Generate HDL**, the **Generation** dialog box appears.
5. Specify output file generation options, and then click **Generate**. The IP variation files generate according to your specifications.
6. To generate a simulation testbench, click **Generate > Generate Testbench System**.
7. To generate an HDL instantiation template that you can copy and paste into your text editor, click **Generate > HDL Example**.
8. Click **Finish**. The parameter editor adds the top-level *.qsys* file to the current project automatically. If you are prompted to manually add the *.qsys* file to the project, click **Project > Add/Remove Files in Project** to add the file.
9. After generating and instantiating your IP variation, make appropriate pin assignments to connect ports.

Figure 4-1: IP Parameter Editor

## Files Generated for Altera IP Cores

The Quartus software generates the following IP core output file structure.

Figure 4-2: IP Core Generated Files

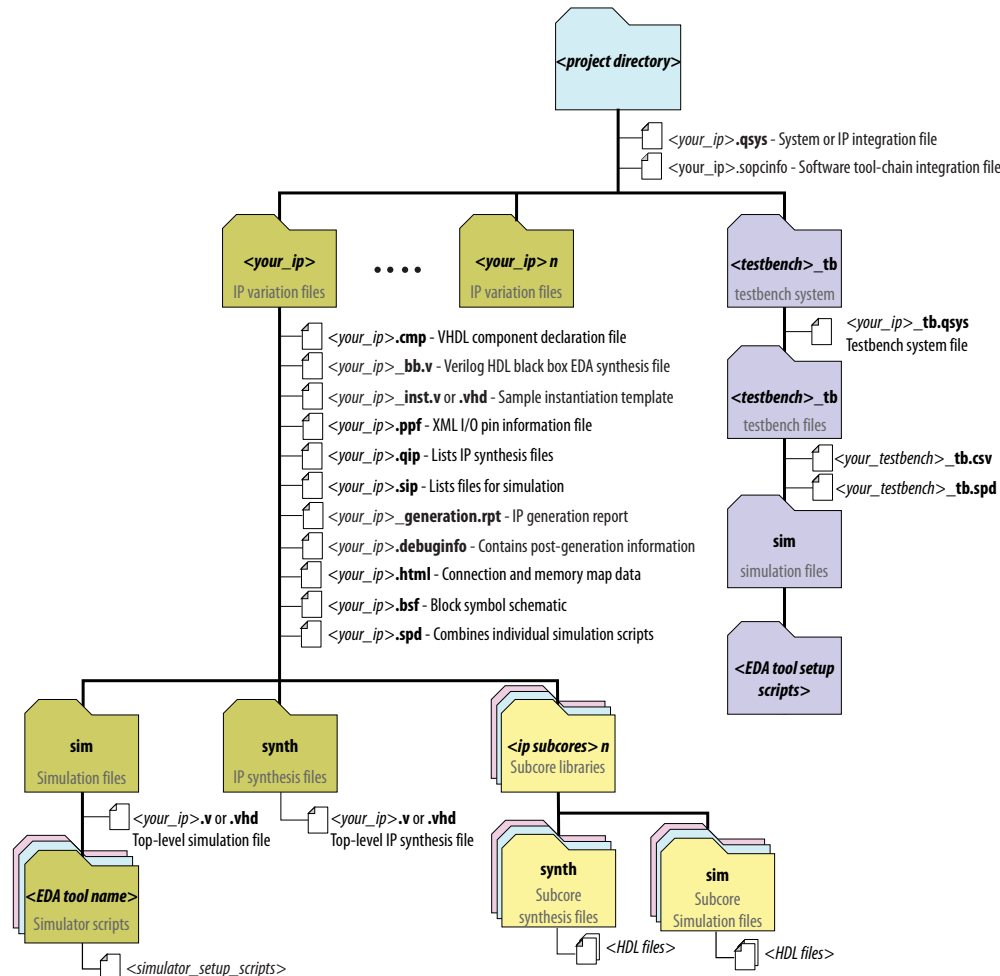

Table 4-1: IP Core Generated Files

File Name	Description
<b>&lt;my_ip&gt;.qsys</b>	The Qsys system or top-level IP variation file. <my_ip> is the name that you give your IP variation.
<b>&lt;system&gt;.sopcinfo</b>	<p>Describes the connections and IP component parameterizations in your Qsys system. You can parse its contents to get requirements when you develop software drivers for IP components.</p> <p>Downstream tools such as the Nios II tool chain use this file. The .sopcinfo file and the system.h file generated for the Nios II tool chain include address map information for each slave relative to each master that accesses the slave. Different masters may have a different address map to access a particular slave component.</p>

File Name	Description
<b>&lt;my_ip&gt;.cmp</b>	The VHDL Component Declaration ( <b>.cmp</b> ) file is a text file that contains local generic and port definitions that you can use in VHDL design files.
<b>&lt;my_ip&gt;.html</b>	A report that contains connection information, a memory map showing the address of each slave with respect to each master to which it is connected, and parameter assignments.
<b>&lt;my_ip&gt;_generation.rpt</b>	IP or Qsys generation log file. A summary of the messages during IP generation.
<b>&lt;my_ip&gt;.debuginfo</b>	Contains post-generation information. Used to pass System Console and Bus Analyzer Toolkit information about the Qsys interconnect. The Bus Analysis Toolkit uses this file to identify debug components in the Qsys interconnect.
<b>&lt;my_ip&gt;.qip</b>	Contains all the required information about the IP component to integrate and compile the IP component in the Quartus software.
<b>&lt;my_ip&gt;.csv</b>	Contains information about the upgrade status of the IP component.
<b>&lt;my_ip&gt;.bsf</b>	A Block Symbol File ( <b>.bsf</b> ) representation of the IP variation for use in Quartus Block Diagram Files ( <b>.bdf</b> ).
<b>&lt;my_ip&gt;.spd</b>	Required input file for <code>ip-make-simscript</code> to generate simulation scripts for supported simulators. The <b>.spd</b> file contains a list of files generated for simulation, along with information about memories that you can initialize.
<b>&lt;my_ip&gt;.ppf</b>	The Pin Planner File ( <b>.ppf</b> ) stores the port and node assignments for IP components created for use with the Pin Planner.
<b>&lt;my_ip&gt;_bb.v</b>	You can use the Verilog black-box ( <b>_bb.v</b> ) file as an empty module declaration for use as a black box.
<b>&lt;my_ip&gt;.sip</b>	Contains information required for NativeLink simulation of IP components. You must add the <b>.sip</b> file to your Quartus project.
<b>&lt;my_ip&gt;_inst.v or _inst.vhd</b>	HDL example instantiation template. You can copy and paste the contents of this file into your HDL file to instantiate the IP variation.
<b>&lt;my_ip&gt;.regmap</b>	If IP contains register information, <b>.regmap</b> file generates. The <b>.regmap</b> file describes the register map information of master and slave interfaces. This file complements the <b>.sopcinfo</b> file by providing more detailed register information about the system. This enables register display views and user customizable statistics in the System Console.

File Name	Description
<b>&lt;my_ip&gt;.svd</b>	Allows HPS System Debug tools to view the register maps of peripherals connected to HPS within a Qsys system.  During synthesis, the .svd files for slave interfaces visible to System Console masters are stored in the .sof file in the debug section. System Console reads this section, which Qsys can query for register map information. For system slaves, Qsys can access the registers by name.
<b>&lt;my_ip&gt;.v</b> or <b>&lt;my_ip&gt;.vhd</b>	HDL files that instantiate each submodule or child IP core for synthesis or simulation.
<b>mentor/</b>	Contains a ModelSim® script <b>msim_setup.tcl</b> to set up and run a simulation.
<b>aldec/</b>	Contains a Riviera-PRO script <b>rivierapro_setup.tcl</b> to setup and run a simulation.
<b>/synopsys/vcs</b> <b>/synopsys/vcsmx</b>	Contains a shell script <b>vcs_setup.sh</b> to set up and run a VCS® simulation.  Contains a shell script <b>vcsmx_setup.sh</b> and <b>synopsys_sim.setup</b> file to set up and run a VCS MX® simulation.
<b>/cadence</b>	Contains a shell script <b>ncsim_setup.sh</b> and other setup files to set up and run an NCSIM simulation.
<b>/submodules</b>	Contains HDL files for the IP core submodule.
<b>&lt;child IP cores&gt;/</b>	For each generated child IP core directory, Qsys generates <b>/synth</b> and <b>/sim</b> sub-directories.

## Simulating Altera IP Cores in other EDA Tools

The Quartus II software supports RTL and gate-level design simulation of Altera IP cores in supported EDA simulators. Simulation involves setting up your simulator working environment, compiling simulation model libraries, and running your simulation.

You can use the functional simulation model and the testbench or example design generated with your IP core for simulation. The functional simulation model and testbench files are generated in a project subdirectory. This directory may also include scripts to compile and run the testbench. For a complete list of models or libraries required to simulate your IP core, refer to the scripts generated with the testbench. You can use the Quartus II NativeLink feature to automatically generate simulation files and scripts. NativeLink launches your preferred simulator from within the Quartus II software.

Figure 4-3: Simulation in Quartus II Design Flow

**Note:** Post-fit timing simulation is not supported for 28nm and later device architectures. Altera IP supports a variety of simulation models, including simulation-specific IP functional simulation models and encrypted RTL models, and plain text RTL models. These are all cycle-accurate models. The models support fast functional simulation of your IP core instance using industry-standard VHDL or Verilog HDL simulators. For some cores, only the plain text RTL model is generated, and you can simulate that model. Use the simulation models only for simulation and not for synthesis or any other purposes. Using these models for synthesis creates a nonfunctional design.

#### Related Information

#### [Simulating Altera Designs](#)

## UFM Avalon-MM Operating Modes

The UFM operating modes use Avalon-MM interface.

### UFM Read Status and Control Register

You can access the control register value through the Avalon-MM control slave interface.

**Figure 4-4: Read Status and Control Register**

The figure below shows the timing diagram for the read status and control register.

To use the control register, assert the `read` signal and send the control register address to the control slave address.

The flash IP core then sends the register value through the `readdata` bus.

## UFM Write Control Register

You can write the control register value through Avalon-MM control slave interface.

**Figure 4-5: Write Control Register**

The figure below shows the timing diagram for the write control register.

To write the control register, assert the `write` signal.

The flash IP core then sends address `0x01` (control register) and `writedata` (register value) to control the slave interface.

## UFM Write Operation

The UFM offers a single 32-bit write operation.

To perform a UFM write operation, follow these steps:

1. Disable the write protection mode. Write 0 into the write protection register for the sector of the given data through the Avalon-MM control interface.
2. Write the following data into flash through the Avalon-MM data interface.
  - Address: legal address (from Avalon-MM address map)
  - Data: user data

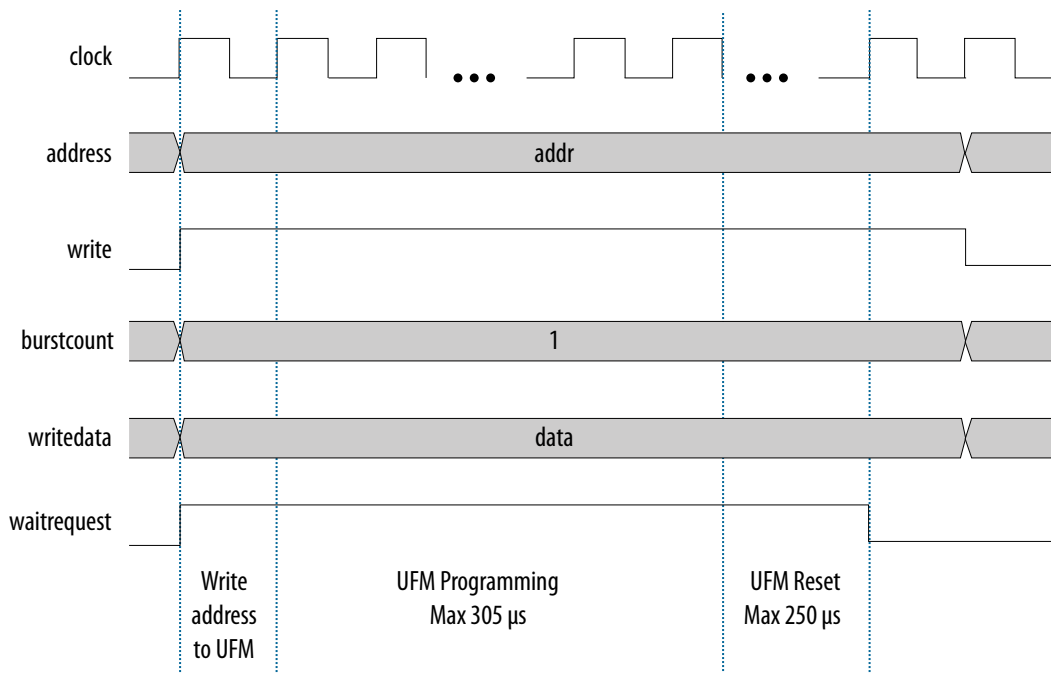

Set burstcount to 1 (parallel mode) or 32 (serial mode).

3. The flash IP core sets the `busy` field in the status register to 2'b10 when the write operation is in progress.
4. If the operation goes well, the flash IP core sets the write successful field in the status register to 1'b1 or write successful. The flash IP core sets the write successful field in the status register to 1'b0 (failed) if one of the following conditions takes place:
  - The burst count is not equal to 1 (parallel mode) or 32 (serial mode).
  - The given address is out of range.
  - The sector protection mode or write protection mode of the corresponding sector is not clear (the value is not 1'b0).
5. Repeat the earlier steps if you want to perform another write operation.
6. You have to enable back the write protection mode when the write operation completes. Write 1 into the write protection register for the corresponding sector through the Avalon-MM control interface.

**Note:** Check the status register after each write to make sure the write operation is successful (write successful).

**Figure 4-6: Write Operation in Parallel Mode**

The figure below shows the write data timing diagram in parallel mode.

**Figure 4-7: Write Operation in Serial Mode**

The figure below shows the write data timing diagram in serial mode.

## UFM Sector Erase Operation

The sector erase operation allows the UFM to erase by sectors.

To perform a UFM sector erase operation, follow these steps:

1. Disable the write protection mode. Write 0 into the write protection register for the sector through the Avalon-MM control interface.
2. Write the appropriate bits into the control register to select the sector erase location. The flash IP core stores the sector erase address and initiates the sector erase operation.

**Note:** The IP core only accepts the sector erase address when it is in IDLE state; *busy* field at status register is 2'b00. If the IP core is busy, it will ignore the sector erase address.

3. The flash IP core sets the *busy* field in the status register to 2'b01 when the erase operation is in progress.
4. The flash IP core then asserts the *waitrequest* signal if there are any new incoming read or write commands from the data interface.
5. The flash IP core erases the sector. It stores the physical flash erase result in the erase successful field in the status register when the sector erase operation completes.

**Note:** The maximum erase time is 350 ms.

6. The flash IP core sets the erase successful field in the status register to 1'b0 (failed) if one of the following conditions takes place:
  - You send an illegal sector number.
  - The sector protection mode or write protection mode of the corresponding sector is not clear (the value is not 1'b0)
7. Repeat the earlier steps if you want to perform another sector erase operation.
8. You have to enable back the write protection mode when the sector erase operation completes. Write 1 into the write protection register for the corresponding sector through the Avalon-MM control interface.

**Note:** Check the status register after each erase to make sure the erase operation is successful (erase successful).

## UFM Page Erase Operation

The page erase operation allows the UFM to erase by pages.

To perform a UFM page erase operation, follow these steps:

1. Disable the write protection mode. Write 0 into the write protection register for the sector through the Avalon-MM control interface.
2. Write the appropriate bits into the control register to select the page erase location. The flash IP core stores the page erase address and initiates the page erase operation.

**Note:** The IP core only accepts the page erase address when the IP is in IDLE state; `busy` field at status register is `2'b00`. If the IP core is busy, it will ignore the page erase address.

3. The flash IP core sets the `busy` field in the status register to `2'b01` when the erase operation is in progress.
4. The flash IP core then asserts the `waitrequest` signal if there are any new incoming read or write commands from the data interface.
5. The flash IP core erases the page. It stores the physical flash erase result in the erase successful field in the status register when the page erase operation completes.

**Note:** The maximum erase time is 350 ms.

6. The flash IP core sets the erase successful field in the status register to `1b'0` (failed) if you send an illegal address.
7. Repeat the earlier steps if you want to perform another page erase operation.
8. You have to enable back the write protection mode when the page erase operation completes. Write 1 into the write protection register for the corresponding page through the Avalon-MM control interface.

**Note:** Check the status register after each erase to make sure the erase operation is successful (erase successful).

## UFM Read Operation

The UFM offers a single 32-bit read operation.

To perform a read operation, the address register must be loaded with the reference address where the data is or is going to be located in the UFM.

To perform a UFM read operation, follow these steps:

1. Assert the `read` signal to send the legal data address to the data slave interface.
2. Set the burstcount to 1 (parallel mode) or 32 (serial mode).
3. The flash IP core asserts the `waitrequest` signal when it is busy.
4. The flash IP core asserts the `readdatavalid` signal and sends the data through the `readdata` bus.
5. The flash IP core sets the `busy` field in the status register to `2'b11` when the read operation is in progress.
6. If the operation goes well, the flash IP core sets the read successful field in the status register to `1'b1` or read successful. It sets the read successful field in the status register to `1'b0` (failed) and returns empty flash if you try to read from an illegal address or protected sector.

The following figures show the timing diagrams for the read operations for the different MAX 10 devices in parallel and serial modes.

**Figure 4-8: Read Operation for 10M04, 10M08, 10M16 and 10M25 Devices in Parallel Mode****Figure 4-9: Read Operation for 10M40 and 10M50 Devices in Parallel Mode**

Figure 4-10: Read Operation for MAX 10 Devices in Serial Mode

## UFM Burst Read Operation

The burst read operation is a streaming 32-bit read operation.

The burst read operation offers the following modes:

- Data incrementing burst read—allows a maximum of 128 burst counts.
- Data wrapping burst read—has fixed burst counts of 2 (10M04/08) and 4 (10M16/25/40/50)

To perform a UFM burst read operation, follow these steps:

1. Assert the `read` signal and send the legal `burstcount` and legal data addresses to the data interface.
2. The flash IP core asserts the `waitrequest` signal when it is busy.
3. The flash IP core then asserts the `readdatavalid` signal and sends the data through the `readdata` bus.

**Note:** For data wrapping burst read operation, if the address reaches the end of the flash, it wraps back to the beginning of the flash and continues reading.

4. The flash IP core sets the `busy` field in the status register to `2'b11` or `busy_read` when the read operation is in progress.
5. If the operation goes well, the flash IP core sets the `read successful` field in the status register to `1'b1` or `read successful`. It sets the `read successful` field in the status register to `1'b0` (failed) and changes all empty flash to 1 if you try to read from an illegal address or protected sector.

## UFM Data Incrementing Burst Read

The following figures show the timing diagrams for the data incrementing burst read operations for the different MAX 10 devices.

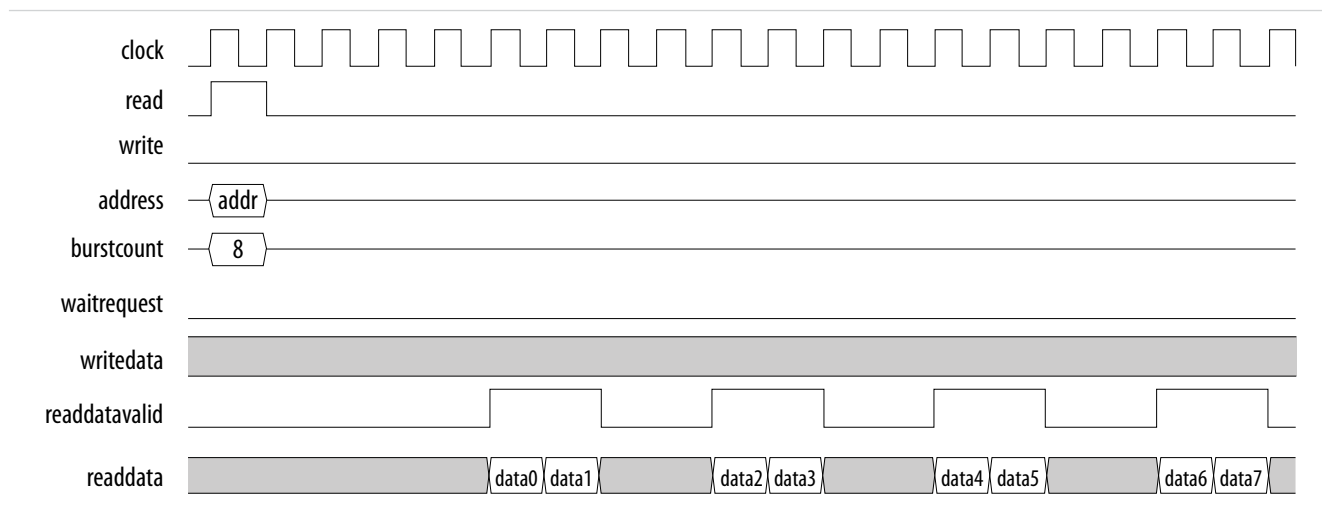

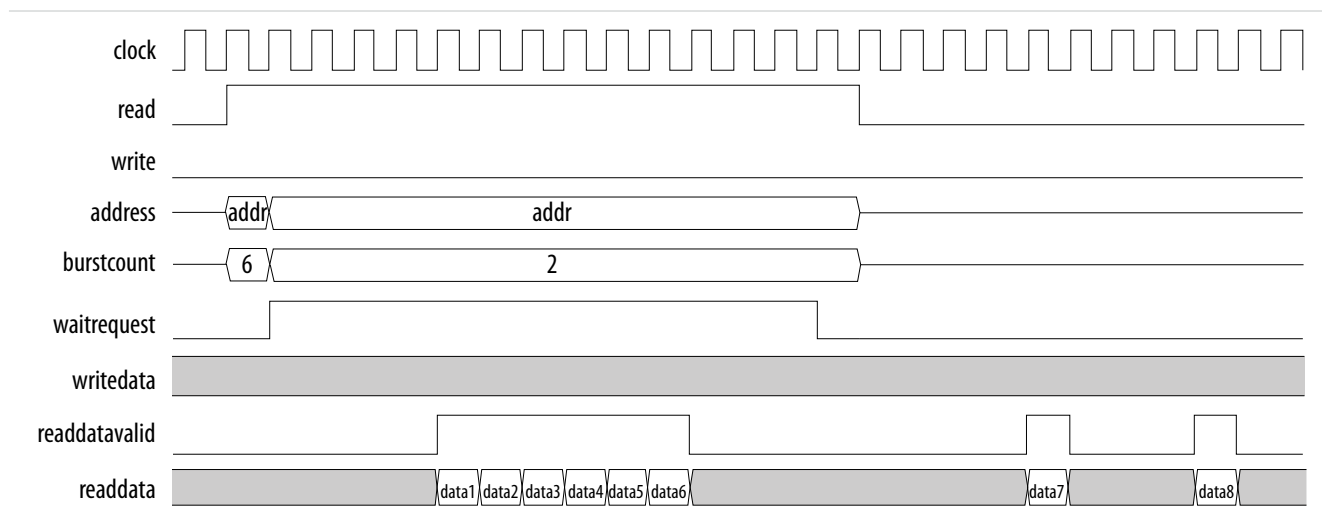

**Figure 4-11: Incrementing Burst Read Operation for 10M04 and 10M08 Devices in Parallel Mode****Figure 4-12: Incrementing Burst Read Operation for 10M16 and 10M25 Devices in Parallel Mode**

Figure 4-13: Incrementing Burst Read Operation for 10M50 Devices in Parallel Mode

Figure 4-14: Unaligned Address Incrementing Burst Read Operation for 10M50 Devices in Parallel Mode

Figure 4-15: Incrementing Burst Read Operation for MAX 10 Devices in Serial Mode

### UFM Data Wrapping Burst Read

The UFM IP supports data wrapping when it receives an unaligned address.

**Note:** Wrapping burst read is available only for parallel interface.

Table 4-2: Data Wrapping Support for MAX 10 Devices

Device	Data Register Length	Flash IP Data Bus Width	Fixed Supported Burst Count	Data Wrapping
10M04, or 10M08	32	64	2	<p>The address wraps back to the previous boundary after 64 bits or 2 cycles. For example, for a wrapping in a 32-bit data interface:</p> <ol style="list-style-type: none"> <li>1. Start address is 0x01</li> <li>2. Address sequence will be 0x01, then back to address 0x00</li> </ol>
10M16, 10M25, 10M40, or 10M50	32	128	4	<p>The address wraps back to the previous boundary after 128 bits or 4 cycles. For example, for a wrapping in a 32-bit data interface:</p> <ol style="list-style-type: none"> <li>1. Start address is 0x02</li> <li>2. Address sequence will be 0x02 and 0x03, then back to address 0x00 and 0x01</li> </ol>

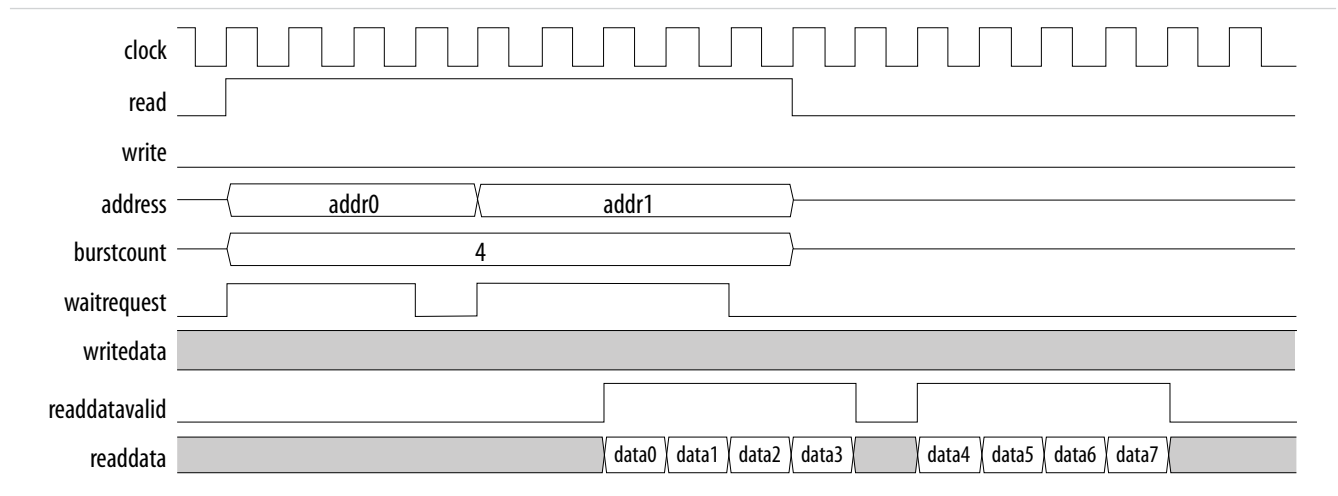

The following figures show the timing diagrams for the data wrapping burst read operations for the different MAX 10 devices.

**Figure 4-16: Wrapping Burst Read Operation for 10M04 and 10M08 Devices**

**Figure 4-17: Wrapping Burst Read Operation for 10M16 and 10M25 Devices**

**Figure 4-18: Wrapping Burst Read Operation for 10M40 and 10M50 Devices**

This section provides information about the Altera On-Chip Flash IP Core parameters, signals, and registers.

## Altera On-Chip Flash Parameters

The following table lists the parameters for the Altera On-Chip Flash IP core.

**Table 5-1: Altera On-Chip Flash IP Core Parameters**

Parameters	Default Value	Description				
Data interface	Parallel	Allows you to select the type of interface. You can choose parallel or serial.  <b>Note:</b> 10M02 devices support only serial interface.				
Read burst mode	Incrementing	<div>Allows you to select the type of read burst mode. You can choose incrementing or wrapping.</div> <table><tr><td>Incrementing mode</td><td>Burstcount range is 1, 2, 4, 7, ... 128</td></tr><tr><td>Wrapping mode</td><td>Burstcount fixed to 2 or 4</td></tr></table> <div><b>Note:</b> Serial mode supports only incrementing mode.</div>	Incrementing mode	Burstcount range is 1, 2, 4, 7, ... 128	Wrapping mode	Burstcount fixed to 2 or 4
Incrementing mode	Burstcount range is 1, 2, 4, 7, ... 128					
Wrapping mode	Burstcount fixed to 2 or 4					
Read burst count	2	<div>Allows you the flexibility to adjust the burst count bus width.</div> <ul style="list-style-type: none"><li>Parallel mode: This setting represents the maximum burst count number.</li><li>Serial mode: This setting supports stream read and represents the words to be read for each read operation. The Avalon-MM interface burst count bus width is equal to 32*read burst count.</li></ul>

ISO  
9001:2008  
Registered

Parameters	Default Value	Description
Configuration mode	Single uncompressed image	Allows you to select the configuration mode. You can choose one of these options: <ul style="list-style-type: none"> <li>Dual compressed images</li> <li>Single uncompressed image: Accesses CFM2 sector as UFM</li> <li>Single compressed image: Accesses CFM2 and CFM1 sectors as UFM</li> <li>Single uncompressed image with memory initialization</li> <li>Single compressed image with memory initialization</li> </ul>
Flash Memory	—	The sector ID, address range value, and flash type are generated dynamically by hardware <b>.tcl</b> based on the device and configuration mode you select. Indicates the address mapping for each sector and adjusts the <b>Access Mode</b> for each sector individually.  <b>Note:</b> Only CFM sectors support <b>Hidden</b> access mode.
Clock frequency	116.0 MHz	Key in the appropriate clock frequency in MHz. The maximum frequency is 116.0 MHz for parallel interface and 7.25 MHz for serial interface.
Initialize flash content	Off	Turn on this option to initialize the flash content.
Enable non-default initialization file	Off	Turn on this option to enable your preferred initialization file. If you choose to have a non-default file, type the filename or select the <b>.hex</b> file using the browse button.
User created hex or mif file	—	This option is only available if you turn on <b>Enable non-default initialization file</b> . Assign your own <b>.hex</b> or <b>.mif</b> filename.
User created dat file for simulation	—	This option is only available if you turn on <b>Enable non-default initialization file</b> . Assign your own simulation filename.

## Altera On-Chip Flash Signals

The following table lists the signals for the Altera On-Chip Flash IP core.

**Table 5-2: Avalon-MM Slave Input and Output Signals for Parallel and Serial Modes.**

Signal	Width	Direction	Description
<b>Clock and Reset</b>			
clock	1	Input	System clock signal that clocks the entire peripheral.

Signal	Width	Direction	Description
reset_n	1	Input	System synchronous reset signal that resets the entire peripheral. The IP core asserts this signal asynchronously. This signal becomes synchronous in the IP core after the rising edge of the clock.
<b>Control</b>			
avmm_csr_addr	1	Input	Avalon-MM address bus that decodes registers.
avmm_csr_read	1	Input	Avalon-MM read control signal. The IP core asserts this signal to indicate a read transfer. If present, the readdata signal is required.
avmm_csr_readdata	32	Output	Avalon-MM read back data signal. The IP core asserts this signal during read cycles.
avmm_csr_write	1	Input	Avalon-MM write control signal. The IP core asserts this signal to indicate a write transfer. If present, the writedata signal is required.
avmm_csr_writedata	32	Input	Avalon-MM write data bus. The bus master asserts this bus during write cycles.
<b>Data</b>			
avmm_data_addr	User-defined	Input	Avalon-MM address bus that indicates the flash data address. The width of this address depends on your selection of device and configuration mode.
avmm_data_read	1	Input	Avalon-MM read control signal. The IP core asserts this signal to indicate a read transfer. If present, the readdata signal is required.
avmm_data_readdata	<ul style="list-style-type: none"> <li>Parallel mode: 32</li> <li>Serial mode: 1</li> </ul>	Output	Avalon-MM read back data signal. The IP core asserts this signal during read cycles.
avmm_data_write	1	Input	Avalon-MM write control signal. The IP core asserts this signal to indicate a write transfer. If present, the writedata signal is required.
avmm_data_writedata	<ul style="list-style-type: none"> <li>Parallel mode: 32</li> <li>Serial mode: 1</li> </ul>	Input	Avalon-MM write data bus. The bus master asserts this bus during write cycles.
avmm_data_waitrequest	1	Output	The IP core asserts this bus to pause the master when the IP core is busy during read or write operations.
avmm_data_readdata-valid	1	Output	The IP core asserts this signal when the readdata signal is valid during read cycles.

Signal	Width	Direction	Description								
avmm_data_burstcount	User-defined	Input	<div><div>The bus master asserts this signal to initiate a burst read operation.</div><div><ul style="list-style-type: none"><li>In write operations, the burstcount is always fixed to 1 for parallel mode and 32 for serial mode.</li><li>In incrementing burst read mode, the supported read burstcount range:<table><tr><td>Parallel mode</td><td>1-2<sup>(burstcount width-1)</sup></td></tr><tr><td>Serial mode</td><td>1-128*32</td></tr></table></li><li>In wrapping burst read mode (parallel mode only), the supported read burstcount is fixed to 2 and 4.<table><tr><td>10M04, and 10M08</td><td>2</td></tr><tr><td>10M16, 10M25, 10M40 and 10M50</td><td>4</td></tr></table></li></ul></div></div>	Parallel mode	1-2 <sup>(burstcount width-1)</sup>	Serial mode	1-128*32	10M04, and 10M08	2	10M16, 10M25, 10M40 and 10M50	4
Parallel mode	1-2 <sup>(burstcount width-1)</sup>										
Serial mode	1-128*32										
10M04, and 10M08	2										
10M16, 10M25, 10M40 and 10M50	4										

## Altera On-Chip Flash Registers

The following table lists the address mapping and registers for the Altera On-Chip Flash IP core.

**Table 5-3: Altera On-Chip Flash Control Address Mapping**

Register	Address	Access	Description
Status Register	0x00	Read only	Stores the status and result of recent operations and sector protection mode.
Control Register	0x01	Read/Write	Stores the following information: <ul style="list-style-type: none"> <li>Page erase address</li> <li>Sector erase address</li> <li>Sector write protection mode</li> </ul>

**Table 5-4: Altera On-Chip Flash Status Register**

Bit Offset	Field	Default Value	Description
1-0	busy	2'b00	2'b00 IDLE 2'b01 BUSY_ERASE 2'b10 BUSY_WRITE 2'b11 BUSY_READ
2	rs (read successful)	1'b0	1'b0 Read failed 1'b1 Read successful

Bit Offset	Field	Default Value	Description
3	ws (write successful)	1'b0	1'b0 Write failed 1'b1 Write successful
4	es (erase successful)	1'b0	1'b0 Erase failed 1'b1 Erase successful
5	sp (UFM1 protection bit)	—	The IP core sets these bits based on the specified device and configuration mode. If the IP core sets one of these bits, you cannot read or write on the specified sector.
6	sp (UFM0 protection bit)	—	
7	sp (CFM2 protection bit)	—	
8	sp (CFM1 protection bit)	—	
9	sp (CFM0 protection bit)	—	
31–10	dummy (padding)	—	All of these bits are set to 1.

**Table 5-5: Altera On-Chip Flash Control Register**

Bit Offset	Field	Default Value	Description
19–0	pe (page erase address)	All 1's	Sets the page erase address to initiate a page erase operation. The IP core only accepts the page erase address when it is in IDLE state. Otherwise, the page address will be ignored.  The legal value is any available address. The IP core erases the corresponding page of the given address

Bit Offset	Field	Default Value	Description														
22–20	se (sector erase address)	3'b111	<div>Sets the sector erase address to initiate a sector erase operation. The IP core only accepts the sector erase address when it is in IDLE state. Otherwise, the page address will be ignored.</div> <table><tr><td>3'b001</td><td>UFM1</td></tr><tr><td>3'b010</td><td>UFM0</td></tr><tr><td>3'b011</td><td>CFM2</td></tr><tr><td>3'b100</td><td>CFM1</td></tr><tr><td>3'b101</td><td>CFM0</td></tr><tr><td>3'b111</td><td>Not set</td></tr><tr><td>Other values</td><td>Illegal address</td></tr></table> <div><b>Note:</b> If you set both sector address and page address at the same time, the sector erase address gets the priority. The IP core accepts and executes the sector erase address and ignores the page erase address.</div>	3'b001	UFM1	3'b010	UFM0	3'b011	CFM2	3'b100	CFM1	3'b101	CFM0	3'b111	Not set	Other values	Illegal address
3'b001	UFM1																
3'b010	UFM0																
3'b011	CFM2																
3'b100	CFM1																
3'b101	CFM0																
3'b111	Not set																
Other values	Illegal address																
23	wp (UFM1 write protection)	1	<div>The IP core uses these bits to protect the sector from write and erase operation. You must clear the corresponding sector write protection bit before your write or erase the sector.</div> <table><tr><td>1'b0</td><td>Disable write protected mode</td></tr><tr><td>1'b1</td><td>Enable write protected mode</td></tr></table>	1'b0	Disable write protected mode	1'b1	Enable write protected mode										
1'b0	Disable write protected mode																
1'b1	Enable write protected mode																
24	wp (UFM0 write protection)	1															
25	wp (CFM2 write protection)	1															
36	wp (CFM1 write protection)	1															
47	wp (CFM0 write protection)	1															
31–28	dummy (padding)	—	All of these bits are set to 1.
